

Solana Max (SMAX) — Whitepaper (Draft)

1. Executive Summary

Solana Max (SMAX) is a community-driven token built on the Solana blockchain. SMAX aims to create a sustainable token economy that balances growth, fair distribution, and anti-dump mechanisms — enabling developers and the community to build utilities, staking, and governance over time.

2. Vision & Mission

****Vision:**** To empower the Solana community with a reliable, fair, and developer-friendly token that funds open-source growth and on-chain utility.

****Mission:**** Build transparent tokenomics, enforce strong security and multisig controls, and support community programs and partnerships.

3. Token Specification

- Token name: Solana Max
- Symbol: SMAX
- Standard: SPL Token on Solana
- Total supply: 1,000,000,000 SMAX
- Decimals: 6

4. Allocation

Category	%	Amount
---	---	---:
Team & Founder	25%	250,000,000
Liquidity	40%	400,000,000
Community Rewards	20%	200,000,000
Development & Partnerships	15%	150,000,000

5. Vesting & Unlock Schedule

- **Team (250,000,000):** 1-month cliff, then monthly linear unlock over 5 months (50M at cliff, then 40M monthly). Total vesting period = 6 months.
- **Liquidity (400,000,000):** Add to liquidity pools at launch and lock LP tokens for at least 12 months; staged unlock based on milestones.
- **Community Rewards (200,000,000):** Distributed via airdrops, staking, governance incentives, and bounty programs.
- **Dev & Partnerships (150,000,000):** Multisig-controlled treasury; release per milestone.

6. Anti-dump & Anti-bot Measures

1. **Vesting and Cliff** — prevents large team token dumping at TGE.
2. **Liquidity lock** — LP tokens locked for a negotiated period to build trust.
3. **Per-wallet caps at TGE** — small per-wallet buy limits for the first 24–72 hours.
4. **Optional on-chain cooldown** via a small program to prevent rapid repeat buys.
5. **Multisig operations** for treasury and admin controls.

7. Governance & Multisig

Key admin operations (token authority changes, treasury moves, LP unlocking) will be performed with a multisig wallet (suggested 3-of-5) to ensure distributed control.

8. Roadmap

- Q1 — Local & Devnet testing, tokenomics finalization
- Q2 — Security review, whitepaper finalization, community building
- Q3 — Liquidity provisioning, lock LP, initial Mainnet launch
- Q4 — Listing & partnerships, staking & governance rollout

9. **Security & Audit**

Before Mainnet launch, a third-party security review / audit is recommended. Smart-contract logic (if any) should be unit-tested and audited.

10. **Legal & Compliance**

Project team will consult legal advisors for token sale, securities classification, and jurisdictional compliance prior to any public offering.
